Public Health Updates Death Data on COVID-19 Dashboard

Kern County's COVID-19 death data is updated as enough data accumulates to prevent identification of the deceased. While this data is a tool to help our community better understand the impacts of this disease, it is our responsibility to adhere to HIPAA guidelines and ensure patient privacy.

COVID-19 death data is reviewed bi-weekly to determine if we have met the criteria set forth by our HIPAA statistician to release more information related to these deaths. Our last update to local death data occurred on March 18, 2021.

As of April 20, Kern County has had 1,331 deaths due to COVID-19. Below are key findings in the updated COVID-19 death data:

- Ages 65+ continue to be the most affected age group, accounting for 65.7% of all deaths. The 65+ group is very disproportionately affected as it only makes up 11.6% of Kern's population according to CA Department of Finance 2020 population projection and only 9.28% of reported cases. There have been no deaths in children under the age of 18.
- The majority of deaths continue to have comorbidities. Hypertension and Diabetes are the two most common. Only 39 deaths have been reported with no comorbidities.
- Hispanics account for 57.6%, down from 59.1%, of COVID deaths. The CA Department of Finance population projection for 2020 has Hispanics at 52.6% of the population making this the most disproportionately affected race. African Americans make up 6.0% of the population and have 5.3% of the deaths, an increase from 4.9%. The other category has increased from 6.8% to 6.9%. Whites are less affected having 34% of the population but only 30.2% of deaths.
- Males account for 61.0%, an increase from the previous of 59.5% of deaths. Males are more affected as they only account for 50.8% of the population.
